Ishaan Venkat	hvhvuu	isve3361@colorado.edu

Project Description:

A webpage that allows users to input playlists from Spotify and convert to the alternative music streaming platform, Tidal. The converter takes the playlist order from Spotify, grabs each song using Spotify's API, searches using Tidal's API for each song, and adds it to a new playlist. Once the user is satisfied with the content and order of the playlist's songs, the converter creates a new playlist in Tidal. In addition, playlists on the converter can be shared between users, liked and disliked, and commented on.

Contributions:

- Drake Jones
 - Assisted with early webpage programming, worked on initial CSS stylesheets and standardized webpages, did early work on API calls, and set up, connected and finalized the deployment of the Render application and the Render database.
- Ishaan Venkat
 - Built the user authentication system, implementing registration and login with PostgreSQL integration and bcrypt password hashing. On the frontend, I created the profile page and the dedicated playlists page. I also developed both third-party integrations, the Spotify OAuth 2.0 flow for fetching playlists and track data, and the Tidal OAuth 2.0 + PKCE flow for connecting user accounts, which together form the core functionality of the app.
- Curtis Liu
 - Made ideas for extra features, worked/finished login logic, helped with end webpage programming, made a lot of UI changes consistent across the website, worked on logout functionality, made logout consistent across tabs, a lot of small front end changes, worked on small UX + UI changes, and made presentation slides.
- Alex Class
 - Added the templates for our initial pages, planned out our Kanban board and kept it updated, worked on UI and UX via CSS and making JS components, added icons for the project, worked on testing and debugging for the backend, as well as lots of polish and fixes on the CSS, and updated the release notes each week
